Research Projects

- 2018-2019 **Deep Learning Assisted Program Analysis** *Cyber Security Lab, Penn State University*
• develop deep learning assisted Value Set Analysis to facilitate Postmortem Program Analysis. [See P-7]
- 2017-2018 **Vulnerability Reproduction** *Cyber Security Lab, Penn State University*
• perform the in-depth analysis on the reproducibility of crowd-reported security vulnerabilities. [See P-5]
- 2016-2017 **Analysis on software crashes** *Cyber Security Lab, Penn State University*
• analyze core dumps caused by memory corruption vulnerabilities; locate the crash point; restore the stack trace; narrow down code segments carrying vulnerabilities. [See P-1]
• enhance a core dump with execution trace logged through Intel Processor Tracing; perform reverse execution and symbolic execution against the trace; pinpoint the root cause of software crash. [See P-2]
- 2015-2016 **Obfuscation based ROP** *System Security Lab, Nanjing University*
• propose an obfuscation scheme for binaries based on ROP(Return Oriented Programming), which aims to serve as an efficient and deployable anti-reverse-engineering approach. [See P-4]

• source code for the vulnerable software in the LinuxFlaw
- 06/2016 **[Dockerfiles](#)**
• all the useful Dockerfiles and related tools in the LinuxFlaw
- 04/2016 **[TraditionalMitigation](#)**
• Summarize traditional mitigations in GCC to defend Memory Corruption Vulnerability
- 12/2014 **[Linux-insides-zh](#)**
• Chinese Translation of [linux-insides](#). This upstream repo is a book-in-progress about Linux Kernel and its insides.
