## Research Projects

2018-2019 **Deep Learning Assisted Program Analysis** *Cyber Security Lab, Penn State University*  
• Develop deep learning assisted Value Set Analysis to facilitate Postmortem Program Analysis. [See P-7, P-9]

2017-2018 **Vulnerability Reproduction** *Cyber Security Lab, Penn State University*  
• Perform an in-depth analysis on the reproducibility of crowd-reported security vulnerabilities. [See P-5]

2016-2017 **Analysis on Software Crashes** *Cyber Security Lab, Penn State University*  
• Analyze core dumps caused by memory corruption vulnerabilities; locate the crash point; restore the stack trace; narrow down code segments carrying vulnerabilities. [See P-1]  
• Enhance a core dump with execution trace logged through Intel Processor Tracing; perform reverse execution and symbolic execution against the trace; pinpoint the root cause of software crash. [See P-2]  
• Leverage Value-set Analysis to improve the memory alias problem in the POMP, to achieve better effectiveness and efficiency. [See J-1]

2015-2016 **Obfuscation based ROP** *System Security Lab, Nanjing University*  
• Propose an obfuscation scheme for binaries based on ROP (Return Oriented Programming), which aims to serve as an efficient and deployable anti-reverse-engineering approach. [See P-4]

## Open Source Projects

06/2016 **LinuxFlaw**  
• Record all the memory error vulnerabilities we used for our Usenix Security 2018 [see P-5]. We not only disclose the detail of vulnerability reproduction but also try to create docker images about those vulnerabilities as possible as we can.

- 06/2016 [Source-packages](#)
  - Source code for the vulnerable software in the LinuxFlaw
- 06/2016 [Dockerfiles](#)
  - All the useful Dockerfiles and related tools in the LinuxFlaw
